Software Prelab (Simulink MATLAB)

Extract the message signal $m(t)$ from $s(t)$

$$s(t) = \cos(2\pi \times 20000t + \pi \cos(1000\pi t)) \rightarrow (1)$$

\Rightarrow To extract $m(t)$ we need to remove the carrier frequency component

General form of Amplitude Modulation (AM)

$$s(t) = A_c \cos(2\pi f_c t) [1 + m(t)]$$

In this case $\Rightarrow A_c = 1$

$$f_c = 20000 \text{ Hz}$$

$$m(t) = \pi \cos(1000\pi t)$$

From
equation (1)

So, message signal $\Rightarrow m(t) = \pi \cos(1000\pi t)$

$$\phi = K_p A_m, \text{ Assume } A_m = 1$$

$$\pi = K_p \times 1$$

$$K_p = \pi$$

Plot 5 cycle from Message signal $m(t)$ and $s(t)$ Block Diagram

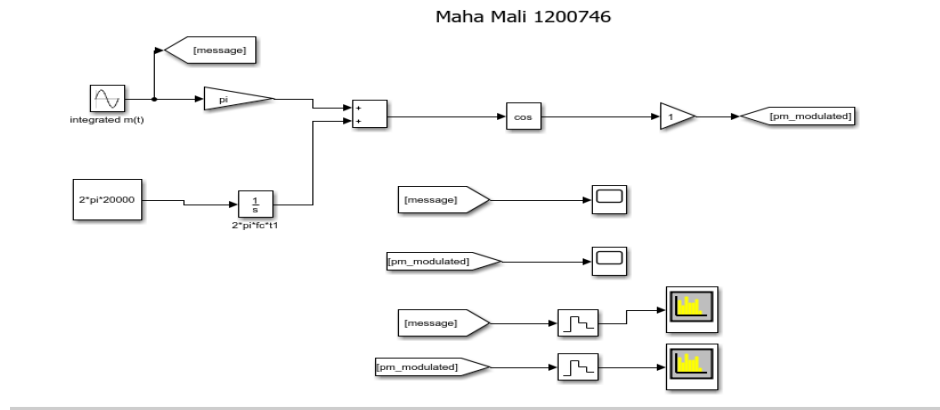

Figure 2: PM Modulation Block Diagram

Message Signal Time Domine

Figure 3: Message Signal in Time domine

From this graph we notice that we got the $m(t)$ that we calculate it by hand with amplitude 1.

Frequency Domine

Figure 4: Frequency Domine

$$M(t) = 1\cos(1000\pi t)$$

$$M(f) = \frac{1}{2}\delta(f - 500) + \frac{1}{2}\delta(f + 500)$$

The figure 5 show that we have two delta one at 500 Hz, and another on -500 Hz , according the equation for m(f).

Modulated signal s(t)

Figure 6: Modulated signal in frequency Domine

Differentiate $s(t)$ with respect to t and plot $ds(t)/dt$
By Hand Solution

$$\frac{ds(t)}{dt} = -\sin(2\pi(20k)t + \pi\cos(1000\pi t)) \cdot (2\pi(20k)) - \pi\sin(1000\pi t) \cdot 1000\pi$$

Figure 7: Differentiate $s(t)$

Using Simulink
Block Diagram

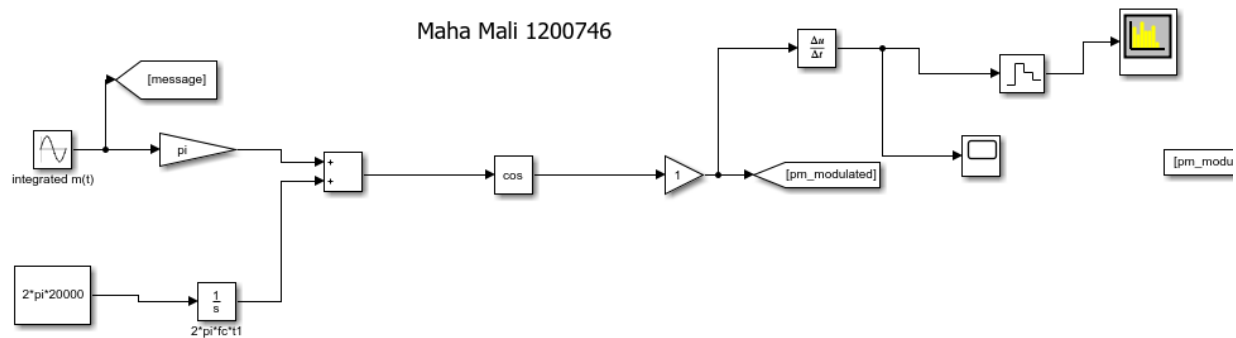

Figure 8: Block Diagram to Differentiate $s(t)$

Time domine

Figure 9: Differentiate $s(t)$ in time domine

Frequency domine

Figure 10: Differentiate $s(t)$ in frequency domine

Differentiating the phase-modulated waveform $s(t) = \cos(2\pi \cdot 20000t + \pi \cdot \cos(1000\pi t))$ with respect to time yields a signal with amplitude variations linked to the frequency of the message signal. This transformation resembles amplitude modulation (AM), where the message signal modulates the carrier's amplitude. The resulting signal takes on AM-like characteristics due to the changing amplitudes associated with the message frequency, demonstrating the interconnected nature of different modulation techniques within the context of signal processing.

Apply $ds(t)/dt$ to an ideal envelope detector

By Hand Solution

Block diagram of the process:

$$s(t) \rightarrow \boxed{\text{differentiate}} \rightarrow \frac{ds(t)}{dt} \rightarrow \boxed{\text{envelope}} \rightarrow y(t) \rightarrow \boxed{\text{DC}} \rightarrow m(t)$$

Definition of $s(t)$:

$$s(t) = \cos(2\pi * 20000t + \pi \cos(1000\pi t))$$

Derivative of $s(t)$:

$$\frac{ds(t)}{dt} = -2\pi * 20000 \sin(2\pi * 20000t) - 1000\pi^2 \sin(1000\pi t)$$

Envelope detector process involves rectifying the signal & then low-pass filtering to extract the envelope

Magnitude of the derivative:

$$\Rightarrow \left| \frac{ds(t)}{dt} \right| = 2\pi * 20000 \sin(2\pi * 20000t) + 1000\pi^2 \sin(1000\pi t)$$

Remove DC Value \Rightarrow The DC Value is:

$$DC = 2\pi * 20000 \sin(2\pi * 20000t)$$

Resulting signal $y(t)$:

$$y(t) = 1000\pi^2 \sin(1000\pi t)$$

We need to show that $y(t)$ is linearly proportional to the message signal $m(t)$

Message signal $m(t)$:

$$m(t) = \pi \cos(1000\pi t)$$

Derivative of $m(t)$:

$$\frac{dm(t)}{dt} = -1000\pi^2 \sin(1000\pi t)$$

Figure 11: Apply $ds(t)/dt$ to an ideal envelope detector

Extract message signal by using phase-locked loop (PLL)

Block Diagram

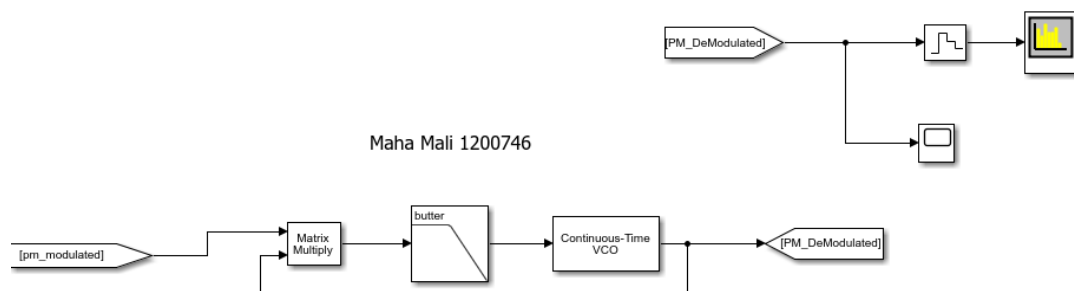

Figure 12: PM Demodulation by PLL Block Diagram

In time Domine

Figure 13: Demodulated signal in time domine

The figure 13 shows the amplitude of the demodulated signal has the same amplitude of message signal which is 1.

In frequency Domine

Figure 14: Demodulated signal in frequency domine

The figure show that the demodulated signal has the same frequency of message signal which is 500 Hz.

Extract the message signal by using the envelop detector Block Diagram
